For mative Assignment 0 The Untyped λ -Calculus

Sam Barrett, 1803086

October 6, 2020

1. (a) Prove that $(\operatorname{add} \underline{2} \underline{3})$ β -reduces to $\underline{5}$, i.e. that $(\operatorname{add} \underline{2} \underline{3}) \mapsto_{\beta}^{*} \underline{5}$. Describe each \mapsto_{β} step.

(b) Define a multiplication operation mul and prove (mul $\underline{2} \underline{3}$) β reduces to $\underline{6}$, i.e., that (mul $\underline{2} \underline{3}$) $\mapsto_{\beta}^{*} \underline{6}$. Describe each \mapsto_{β} step.
Definition of mul:

$\mathtt{mul} = \lambda a. \lambda b. a(\mathtt{add}\ b)\underline{0}$

```
\mathtt{mul}\ \underline{2}\ \underline{3}
                                                                                   ((\lambda a.\lambda b.a(add b)\underline{0})\underline{2}\,\underline{3})
                                                                                                                  2(add 3)0
         \mapsto_{\beta}
                                                                                      \lambda f.\lambda x.f(fx)(\text{add }\underline{3})\underline{0}
